

Managed Security DDoS Protection

MainOne

radware

Protect your enterprise network against cyber attacks and remain online during a Distributed Denial of Service (DDoS) attack.

Hackers across the globe can, at the push of a button, cripple an organization's network and cost enterprise thousands of dollars in losses from network downtime, website unavailability, customer churn, restoration cost as well as damage to brand reputation.

With MainOne's Managed Security, organizations are offered complex and robust DDoS protection as a managed service where all the organization's traffic is routed through MainOne's DDoS mitigation platform, keeping your organization fully protected at all times and maintaining the normal operations of your enterprise's on-premises infrastructure.

Given the growing influence and complexity of DDoS attacks, it is imperative to safeguard your infrastructure and business applications with MainOne's Managed Security solution before the occurrence of an attack.

Features

- Shortest time to protection as traffic is continuously routed through MainOne's DDoS protection.
- Minimal customer involvement - proactively fully-managed by MainOne's battle proven security experts.
- Unlimited service - provides support for unlimited number of attacks, size of attacks and attack duration.

Why MainOne DDoS Protection

Fully Managed Security Service

The service is fully managed, 24x7 by MainOne's Global NOC and Radware's Emergency Response Team (ERT).

Automated 0-Day DDoS Attack Protection

By creating real-time signature based on attack characteristics, creating baselines of normal network, application and user behavior, the service can detect and mitigate zero-day attack within 18 seconds.

Behavioral-Based Detection for Highest Accuracy

Using behavioral-based detection algorithm, MainOne's DDoS Protection service is able to perform in-depth traffic analysis and make predictions quicker and more accurately than traditional methods.

Smart SSL Attack Mitigation

Radware's DDoS technology offers the only SSL-attack mitigation that maintains user data confidentiality and removes operational dependencies between the service provider and the organization when keys are changed.

Multi-layered DDoS Protection

MainOne's DDoS Protection offers multi-layered protection which is optimized for online business and datacenter protection and provides protection from all types of DDoS attack vectors.

Synchronized Operations for Increased Protection

Defense messaging between MainOne's security nodes and Radware's global security nodes share real-time information on normal traffic baselines, protection and attack footprints, thereby eliminating blind spots and protection gaps across an organization's disaggregated network.

Robust Global Cloud Security Network

MainOne's DDoS protection solution leverages Radware's global cloud security network, which scales over 2Tbps of mitigation capacity.
